GENERAL INFORMATION:
APPLICANT: Bright, Gary R.
APPLICANT: Premkumar, D. David
APPLICANT: Chen, Yih-Tai
TITLE OF INVENTION: Novel Fusion Proteins And Assays For Molecular Binding
CURRENT APPLICATION NUMBER: US/10/211,088
CURRENT FILING DATE: 2002-10-15
PRIOR PILLOATION NUMBER: 60/309,395
PRIOR APPLICATION NUMBER: 60/341,589
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 1

TITLE OF INVENTION: METHODS OF TREATMENT USING
NBS-1, ANTIBODIES AND PROTEINS THERETO, AND USES OF THE
ANTIBODIES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

This sequence is a peptide homologue of a region of p53 which binds to mdm2. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in a population of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not overexpress mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 reduction. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

New agents which inhibit interaction of p53 and mdm2 - useful for activating p53, e.g. for treating cancers, viral conditions or other conditions associated with non functional p53 or mdm2

Disclosure, Fig 1; 52pp; English.

This sequence is a peptide homologue of a region of p53 which binds to made. This peptide is used in the construction of a novel agent capable of disrupting the binding of p53 and mdm2 or inhibiting the production of mdm2 in apoulation of cells. This agent is also used in the preparation of a therapeutic for activating p53, where the population of cells do not oversepses mdm2. Inhibiting mdm2 production and/or inhibiting the binding of mdm2 to p53 allows levels of p53 to increase by reducing the clearance of p53 by mdm2, and can be used to activate p53 function. The agents for use in therapeutics for activating p53 can be used for the treatment of cancer, viral conditions or other conditions associated with non-functional p53.

This represents a p53 N-terminal peptide fragment used in an Elisa TIP casay for analysing the interaction between human encogenic protein MDM2 assay for analysing the interaction between human encogenic protein MDM2 and p53. The invention provides peptide derivatives capable of binding to the human MDM2 These peptides can specifically inhibit or block the binding of MDM2 to the human p53 protein, in vitro or in vivo. Inhibiting the interaction between the p53 and MDM2 can induce growth arrest or apoptosis in tumour cells comprising a wild-type p53 and non-elevated company of MDM2. The peptides may be used to identify molecules that bind levels of MDM2. The poptides may be used to identify and design inhibitors of MDM2, p53 binding. They to MDM2 and to identify binding partners especially MDM2, diagnose consistents and for treatment or prevention of disease involving p53/MDM2 interactions. Sepecially tumours and viral infections. The peptides can interactions and viral infections. The peptides can consider and all capability. Rectally, rectally, orally or by injection. By interfering with MDM2/p53 interaction, the peptides can accivate p53 function and commandiation in normal cells. The peptides which mind the MDM2 binding site in p53, have a significantly greater blocking activity compared contribute protein with wild-type p53.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             <u>`</u>

Peptides AAW60202-05 are derived from human p53 protein. The present peptide corresponds to residues 11-35. The peptides are used in the method of the invention. Antibodies that bind to p53 protein are detected by immobilising a p53 peptide directly on to a flow cell of a sensor chip in a biosensor, treating the peptide with a sample of patient serum, diluted in buffer, and measuring binding of antibody to the peptide using the biosensor. The method is used to monitor cancer patients undergoing p53 gene therapy (to determine if an immune response has developed), and also to detect antibodies against mutant forms of p53.

The specification describes a method of synthesis of biologically active substances of determined structure directly in the cells of living organisms containing specific RNA or DNA sequence. The method is based on the hybridisation of two or more oligomers bound with biologically inactive substances to specific RNA or DNA in vivo in the cells of living organisms. After hybridisation of the oligomers, the biologically inactive precursors bound to the oligomers can interact with each to make the active form of the substances. This changing of properties is due to chemical reactions which bind the biologically inactive precursors through a chemical bond into a biologically active form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel methods for the synthesis of biologically active compounds from inactive precursors in the cells of living organisms, useful for producing proteins or polynucleotides -

the whole compound. The methods are useful for producing biologically active compounds from inactive precursors. These compounds may be inhibitors or stimulators of callular metabolism, DNA replication, RNA translation, RNA elongation RNA processing, protein synthesis, protein processing, cellular differentiation, cell division, ion channel transmission, cellular protein and RNA transportation, processes of cellular oxidation, toxins, proteins or RNAs. AAB30523-36 processes of cellular oxidation, toxins, proteins or RNAs. AAB30523-36 processes of cellular oxidation, toxins, proteins or RNAs. AAB30523-36 processes of cellular oxidation, toxins, proteins or RNAs. AAB30523-36 represent peptides which are bound to oligomers AAC62167-80 and AAC62181-94. The peptides are fragments of the tumour suppressor protein p53 and invention is used to produce the tumour suppressor protein p53 from the bound peptides and oligomers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse, Mdm2, murine double minute; phosphoprotein; binding; modulation; tumour suppressor; p53; oncogene; cell cycle arrest; p107; antagonist; inhibition; transcription factor; adenocarcinoma; colon; cancer; breast; lung; scomach; myeloid leukaemia; lymphoma; hyperproliferative;

This peptide corresponds to amino acids wild type human p53 protein. This peptide corresponds to amino acids 6-41 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murino double minute-2 (mdm2) protein (AAM13600). Mdm2 protein is a 90 KD phosphoprotein which binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdm2 protein itself has oncogenic properties, especially in a p53-mull background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptides AAW13602-6 represent peptide fragments derived from the

This peptide corresponds to amino acids able to bind the N-terminal amino acids (1-134) of the murine double are bind the N-terminal amino acids (1-134) of the murine double minute-2 (mdm2) protein (AAW13600). Mdm2 protein is a 90 kD phosphoprotein which binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdm2 protein itself has oncogenic properties, especially in a p53-null background. Mdm2 is observed to unblock cell cycle arrest in G1 caused by over-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the breast, lung or stomach; myeloid leukaemia; B continuous which hyperproliferative conditions when the p54 protein are able to inhibit the oncogenic activity of mdm2. The preparoliferative conditions when the p54 protein are able to inhibit the oncogenic activity of mdm2. The honest, lung or stomach; myeloid leukaemia; professional when the propression of the presst, lung or stomach; myeloid leukaemia; professional when the professional professional
over-expression of the p107 protein. The p53 peptides are examples of antagonists of the invention which are able to inhibit the oncogenic activity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; myeloid leukaemia; Ecell lymphoma, or other hyperpoliferative conditions such as restenosis. Note: this sequence is not given in the specification but is constructed from the wild type human p53 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mouse; Mdm2; murine double minute; phosphoprotein; binding; modulation; tumour suppressor; p53; oncogene; cell cycle arrest; p107; antagonist; inhibition; transcription factor; adenocarcinoma; colon; cancer; breast; lung; stomach; myeloid leukaemia; lymphoma; hyperproliferative;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            restenosis. ```
The peptides AAW13602-6 represent peptide fragments derived from the wild type human p53 protein. This peptide corresponds to amino acids 1-52 of the p53 sequence. The peptides are claimed peptides which are able to bind the N-terminal amino acids (1-134) of the murine double composed to bind the N-terminal amino acids (1-134) of the murine double composed to bind the N-terminal amino acids (1-134) of the murine double composed to bind the N-terminal amino acids (1-134) of the murine double composed to bind the N-terminal amino acids (1-134) of the murine double composed to binds and modulates the activity of the tumour suppressor protein p53. It has now been shown that the mdma protein citself has oncogenic properties, especially in a p53-null background. Composed to unblock cell cycle arrest in G1 caused by cover-expression of the p107 protein. The p53 spetides are examples of antagonists of the invention which are able to inhibit the oncogenic contivity of mdm2. The antagonists are used to treat e.g. adenocarcinoma of the colon; cancer of the breast, lung or stomach; myeloid leukaemia; B coll lymphoma, or other hyperproliferative conditions such as constructed from the wild type human p53 sequence.

Inactivation of the p53 gene has been implicated in the formation, or progression of a wide variety of carcinoma. p53 is thought to interact with the protein product of a gene which is amplified in a number of human tumours, designated MDM2. Polypeptides containing at least amino acids 13-41 of p53, or the DNA encoding these, may be used to inhibit the growth of tumour cells containing MDM2 gene amplification.

AAW07886 represents the human p53 protein which is involved in the development of many cancers. The protein is used here in a method for identifying compounds that interfere with the binding of p53 and MDM-2. In binding the p53 protein, the MDM-2 protein releases a cell from p53-regulated growth, allowing cancers to develop. Therefore compounds identified as interfering with the binding of MDM-2 to p53 are potentially useful in the treatment of human neoplastic cells. In the method pref. one or both of the proteins is a fusion protein esp. with an antibody or antibody fragment which aids separation and identification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present sequence represents a human p53 fragment 13-41 which is necessary for the interaction of MDM-2 and p53. The present invention describes a method for diagnosing a neoplastic disease caused by overexpression of MDM2 protein. The method comprises detecting an elevated cellular amount of this protein. The method is useful for the diagnosis of sarcoma, especially liposarcoma, malignant fibrous histiocytoma or osteosarcoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human MDM2 binding polypeptide - comprises fragments of p53, useful in re-establishing p53-regulated growth control in cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MDM2; tumour; diagnosis; neoplasia; DNA binding protein;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A method has been developed for inhibiting the growth of tumour cells containing a human MDM2 gene amplification. The method comprises treating the tumour cells with a DNA molecule that expresses a crashing to tuman MDM2 protein. The present collypeptide capable of binding to human MDM2 protein. The present invention describes three preferred human MDM2 protein. The present invention describes three preferred polypeptides for binding human MDM2: (1) the polypeptide comprises amino acids 1-50 of p53 (see AAW77240); (2) the polypeptide comprises amino acids 1-41 of p53 (see AAW77240) and at least none additional p53 residues on the N- or C-terminal side, provided that the polypeptide comprises amino acids 13-41 of p53 (see AAW57241) and at least nine additional p53 residues on the N- or C-terminal side, provided that the polypeptide comprises amino acids 13-41 of p53 (see AAW57241) and at least nine additional p53 residues on the N- or C-terminal side, provided that the polypeptide lacks amino acids 138-193 of p53. Some malignant fibrous hieriocytomas and liposarcomas have an MDM2 gene amplification, so detection of increased expression of MDM2 gene products indicates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

The present sequence represents a N-terminal portion of the p53 protein. These amino acid residues have been found to be necessary for the interaction of MDM2 and p53. A cell containing three recombinant but constructs was produced. These constructs encode an MDM2 protein fused to a sequence-specific DNA binding domain, a p53 polypeptide fused to a transcriptional activation domain, and a reporter gene downstream from a DNA element which is recognised by the sequence-specific DNA-binding domain. The cell is used to identify a compound which interferes with the binding of MDM2 and p53. Since MDM2 is overexpressed in tumour cells and since binding of MDM2 to p53 appears to allow tumour cells to escape from p53-regulated growth, compounds that inhibit such binding would be useful as anti-cancer agents.

Glutamate receptor delta-1 chain precursor - rat
NiAlternate names: Asinate receptor
C;Species: Rattus norvegicus (Norway rat)
C;Date: 07-Apr-1994 #sequence_revision 07-Apr-1994 #text_change 20-Aug-1999
C;Accession: S28857; S31222
C;Accession: S28857; S31222
Fillowed, H.; Sprengel, R.; Laurie, D.J.; Koehr, G.; Herb, A.; Seeburg, P.H.; Wisden, W.FEBS Lett. 315, 318-322, 1993
A;Title: The rat delta-1 and delta-2 subunits extend the excitatory amino acid receptor
A;Reference number: S28857; MUID:93138096; PMID:8422924
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A; Experimental source: liver C; Comment: This protein is the product of a tumor suppressor gene, p53, whose inactivatine, C; Comment: This protein is the product of a tumor antigen p53 C; Superfamily: cellular tumor antigen p53 C; Keywords: apoptosis; cell division control; DNA binding; homotetramer; nucleus; phosph F; 164, 167, 227, 231, Binding site: zinc (Cys, His, Cys, Cys) #status predicted F; 395/Binding site: phosphoryl-RNA (Ser) (covalent) #status predicted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A.Introns: 25/2; 32/3; 123/3; 185/1; 259/2; 305/1; 329/3; 365/2

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                BASIC (REPRESSION OF DNA-BINDING).
NUCLEAR LOCALIZATION SIGNAL (POTENTIAL).
PHOSPHORYLATION (BY SIMILARITY).

Conclusionated at the control of the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.

Controlling a set of genes required for this process. One of BAX and FAS antigen expression, or by repression of BCl-2 expression (By similarity).

Controlling binds DNA as a homotetramer (By similarity).

Controlling BIN FORTION: Nuclear.

Controlling BIN FREQUENTLY MUTATED OR INACTIVATED OR INACTIVATED.

Submitted (FEB-1996) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SUBUNIT: Binds DNA as a homotetramer (By similarity).
SUBCELLULAR LOCATION: Nuclear.
DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED

-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces

-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces

-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces

-!- FUNCTION: Acts or apoptosis depending on the physiological

-!- FUNCTION: Acts or apoptosis depending on the physiological

-!- FUNCTION: Acts or apoptosis dependent cell division

by controlling a set of genes required for this process. One of

the activated genes is an inhibitor of cyclin-dependent kinases.

Apoptosis induction seems to be mediated either by stimulation of

BAX and FAS antigen expression, or by repression of Bcl-2

--- SUBUNT: Binds DNA as a homotetramer (By similarity).
--- SUBCELLULAR LOCATION: Nuclear.
--- SUBCELLULAR LOCATION: Nuclear.
--- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF TRANSFORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED IN MANY TYPES OF CANCER.
                                                                                                                                                                                                                                                                                                  Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

                                                                                                                                                                                                                                                                                                                                   DIA Seq. 5:255-259(1995).

-!- FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of bax and FAS antigen expression, or by repression of BCl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   BASIC (REPRESSION OF DNA-BINDING).

Submitted (APR-1997) to the EMBL/GenBank/DDBJ databases.

-I-FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and call type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BCI-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Komori H., Ishiguro N., Horiuchi M., Shinagawa M., Aida Y.;

Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of BGl-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        MEDLINE-97376996; PubMed=9233767; Feitelson M.A., Zhang S.M.; Feitelson M.A., Ranganathan P.N., Clayton M.M., Zhang S.M.; "Partial characterization of the woodchuck tumor suppressor, p53, and its interaction with woodchuck hepatitis virus X antigen in hepatocarcinogenesis."; Oncogene 15:327-336(1997).

Med. Sci. 55:801-805(1993).

-! FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases. Apoptosis induction seems to be mediated either by stimulation of BAX and FAS antigen expression, or by repression of Bc1-2
                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             TISSUB=Lymph node,
